Determination of the Temperature of Soil in Winter by Maximum Thermometers
Meteorol. i gidrologiya, No 6, 1953, pp 40-43

A procedure for observations by maximum thermometers in wells down to depths of 120 cm is described. The magnitude of the error as a function of time of exposure is clarified. A comparison is made with data obtained by extraction thermometers (510 pairs of readings under Moscow in 1951-1952). It turned out that the mean temperature of the layer of soil from 20 to 120 cm according to the maximum thermometers is lower than according to the extraction thermometer by 0.2° . (RZhGeol, No 5, 1954)

TITLE: Errors in the Reading of Ground-frost Measuring Instruments Designed by Ratomskiy and Danilin (Pogreshnosti pokazaniy merzlotomerov Ratomskogo i Danilina)

PERIODICAL: Meteorologiya i gidrologiya, 1958, Nr 11, pp 52-55 (USSR)

ABSTRACT: Ratomskiy's (Ref 2) and Danilin's (Ref 1) instruments are mounted in a steady position and permit the determination of the dynamics of ground freezing and thawing. The construction and the process of observation of both instruments on the whole are based on the same principles, but the instruments used for determining the freezing limit are made of different materials. By means of Ratomskiy's instrument this limit is determined according to the freezing of the soil that has been filled into a metallic telescopic shell; by means of Danilin's instrument water in a rubber hose serves this purpose. The assumption that the soil in the shell and the water in the rubber hose freeze simultaneously with the water in the soil pores entails an inaccuracy since this may occur possibly at various temperatures. At the beginning of winter and in spring both instruments yield, primarily after the melting of the

Card 1/3

Errors in the Reading of Ground-frost Measuring
Instruments Designed by Ratomskiy and Danilin

SOV/50-58-11-17/25

snow cover, distorted values of the depth of freezing and melting. In publications this problem hitherto has been insufficiently investigated. The author checked these depths by means of a drill or by digging out a prospect. The aforesaid measuring instruments were mounted in the Glavnyy botanicheskiy sad AN SSSR (Main Botanical Garden, AS USSR). In this case both the kinds of soil and trees differed from one another; the ground-water level was found in a depth of 0.5-1.0 m. The frequency of the above-mentioned differences (+ and - compared with the check) is listed in table 1 which indicates that Ratomskiy's measuring instrument in 92.3 % of all cases yielded higher values than the check. In 5.2 % equal readings were obtained. Figures 1 and 2 show the deviations of readings from the check at the beginning of winter and in spring. Table 2 and figures 3 and 4 show corresponding results obtained by Danilin's instrument. The author explains the deviations determined and arrives at the following conclusions: 1) Ratomskiy's ground-frost measuring instrument is not very well suited for regions of a low and unstable degree of ground frost. The tube and the filling shell are made of galvanized sheet iron, which

Card 2/3

Errors in the Reading of Ground-frost Measuring
Instruments Designed by Ratomskiy and Danilin

SOV/50-58-11-17/25

possesses a high degree of thermal conductivity. Considerable errors in measurement occur accordingly. Checking measurements are to be carried out in regions where the ground freezes to a sufficient depth (up to a depth of 20-25 cm) at the beginning of winter and in spring during the thawing (up to a depth of 50 cm). 2) During the period of ground thawing Danilin's instrument agrees with the check to a larger extent than Ratomskiy's instrument. But in the case of thawing from above (from the surface) it records a lower depth than the check; on the other hand, a larger depth is determined in the case of thawing from below. After summing up these data a frozen ground layer is obtained that is thicker than the actual one. Accordingly, the time of complete thawing is shifted by 1-3 days. There are 4 figures, 2 tables, and 2 Soviet references.

TITLE: Method of Determining Final Fall Velocities of Grains in Heavy Moving Media. (Metod opredeleniya konechnykh skorostey padeniya zeren v tyazhelykh podvizhnykh sredakh.)

PERIODICAL: Tsvetnyye Metally, 1958, ^{3/}₁ Nr.8, pp.1-4 (USSR).

ABSTRACT: For determining the falling velocities of particles in opaque media (suspensions) visual methods are unsuitable and various electrical systems have been proposed. The authors list the disadvantages of three of these - that of Mitrofanov and Zelinskiy (Ref.1), of Muzylev (Ref.2) and of Goroshko (Ref.3). They go on to describe their own method which is free from many of the listed defects. The electrical part of the method is an improvement on that of the tensometer designed by the Moskovskiy gornyy institut (Moscow Mining Institute). The principle is that as a ferromagnetic grain passes the centre line of an induction core it causes a change in the inductive resistance of the coil, which unbalances the bridge circuit of which the coil forms a part. The impulse is amplified and registered with a millivoltmeter; the same occurs when

Card 1/2

SOV/136-58-8-1/27

Method of Determining Final Fall Velocities of Grains in Heavy Moving Media.

the grain passes a second coil. An oscillographic record (Fig.2) or other means can be used for timing the grain over the distance. An editorial note points out that the authors have not taken into account the difference in suspension speed at the walls and centre of the tube of their apparatus (Fig.1). The authors claim that the apparatus enables the falling speed of grains in heavy media, including ferromagnetic suspensions, moving at a constant speed, to be determined, and suggest that the method could be applied to study grain motion in true solutions as well as suspensions. There are 2 figures, 1 table and 4 Soviet references.

The problem of the structure of Gustavson's hydrocarbon. Ya. M. Slobodin and I. N. Shalkin. *Zhur. Obshch. Khim.* (J. Gen. Chem.) 18, 1115 (1948). Contrary to Murray and Stevenson (C. I. 38, 1159, 3615), the Raman spectrum of the hydrocarbon first obtained by Gustavson (*J. prakt. Chem.* 54, 98, 105 (1896)), if it is synthesized by the action of Zn dust on $(CH_3)_2Br_2C$ in 80-85% alc., and the product is immediately removed from the reaction mixt. (to avoid secondary reactions), then distd. several times (last 2 times over Na), resulting in b. 39-41°, n_D^{20} 1.41847, d_4^{20} 0.7377, M_R 23.25, shows neither the frequency 581 nor 1033 cm^{-1} , and contains neither spiropentane nor other hydrocarbons with a $(CH_3)_2$ ring. By its Raman spectrum, it is a mixt. of methylcyclobutane and 2-methyl-1-butene. The presence of small amts. of isoprene is probable. The formation reaction can be represented by $C(CH_3)_2Br_2 +$

Structure of Gustavson's hydrocarbon. II. Stepwise synthesis of spiropentane. Ya. M. Slobodin and I. N. Shokhor. *Zhur. Obshchei Khim.* (J. Gen. Chem.) 21, 2006-11(1951); cf. Gustavson, *Izvest. Akad. Nauk* (Russ.) 5, 237(1906); *J. prakt. Chem.* [2] 54, 105(1906); 56, 93 (1907); *C.A.* 43, 991d. — Raman analysis of Gustavson's hydrocarbon mixt. showed that the principal components are methylenecyclobutane and EtCMe:CH_2 . The stepwise synthesis of spiropentane (Zelinskii and Kravets, *C.A.* 7, 1176) yields methylenecyclobutane only, since the 3-membered ring gives methylenecyclobutane, confirming the mechanism proposed for isomerization suggested by Favorakii and Batalla (*C.A.* 9, 1750). $\text{C}(\text{CH}_2\text{OH})_4$ (130 g.) and 102 g. Ac_2O refluxed 8 hrs. gave several fractions, including 50% 1,3,3,5-pentaoxetane diacetate, bp 202-3°, which crystallizes in part owing to transposition of Ac groups, depositing pentacrythritol; the higher fractions contained tetra- and triacetates. The product treated with red P and Br in CHCl_3 with ice cooling gave 38% 2,2-bis(bromomethyl)-1,3-propanediol diacetate, bp 182-7°, d_4^{20} 1.6518, n_D^{20} 1.60591, which (190 g.) treated with 150 ml. EtOH , 15 ml. H_2O , and 50 g. Zn dust 2

hrs. on the steam bath gave 1,1-cyclopropanedimethanol diacetate, 44%, bp 135-7°, d_4^{20} 1.0817, n_D^{20} 1.44456, which boiled 6 hrs. with satd. K_2CO_3 soln. gave 55% 1,1-cyclopropanedimethanol, bp 123-7°, d_4^{20} 1.0710, n_D^{20} 1.66435, $\gamma = 38.64$, partly crystg. on standing. A better procedure was to treat the bromide with Zn, sat. the mixt. with NH_4 at 0°, and let stand 2-3 days. The glycol above with PBr₃ and pyridine gave 43% of the bis(bromomethyl)cyclopropane, bp 83-7°, d_4^{20} 1.7895, n_D^{20} 1.53643, $\gamma = 37.94$. This with Zn dust in EtOH with simultaneous distn. gave 47% hydrocarbon (II), bp 41.5-2.5°, d_4^{20} 0.7357, n_D^{20} 1.4162, $\gamma = 30.37$, which, hydrogenated over Pt oxide, readily took up 60% (of theoretical) H_2 . Its const. and behavior confirm its structure as methylenecyclobutane and not a trace of spiropentane was found. Hydrogenation of the Gustavson hydrocarbon gives a time curve with a break indicating hydrogenation of 2 components, whereas II gave a smooth curve; ozonolysis gave cyclobutanone and HCO_2H only. The isomerization to the cyclobutane ring appears to occur

mainly during the treatment of the dibromide, probably with formation of 1-bromo-1-(bromomethyl)cyclobutane from 1,1-bis(bromomethyl)cyclopropane. The Raman spectrum of the dibromide contains elements of 3- and 4-membered rings.

"Action of PCl_3 and PBr_3 on Methylcyclopropylcarbinol," Ya. M. Slobodin, I. N. Shokhor

"Zhur Obshch Khim" Vol XXII, No 2, pp 208-214

By means of Raman spectroscopy, identified products of interaction of PBr_3 with methylcyclopropylcarbinol (I) as α -bromoethylcyclopropane and about 70% 5-bromopentene-2. Established that α -chloroethylcyclopropane, product of interaction of PCl_3 with I, undergoes opening of ring only to small extent. During its prepn and treatment it is subjected to

209T15

USSR/Chemistry - Hydrocarbons (Contd)

Feb 52

partial splitting off of HCl (10-15%) to form 75% vinylcyclopropane (II) and 25% trans-piperylene. Synthesized II and took its Raman spectrum.

CZECH.

Structure of Gantseva's hydrocarbon. IV. Inter-
mediate products of stepwise synthesis of spirocyclic
hydrocarbons and 1,4-dibromocyclobutane. *Sbornik Sbornik*
Chem. Akad. Nauk S.S.S.R. 2, 247 (1965); *C.A.* 48, 13081d. In the
stepwise synthesis of spirocyclic hydrocarbons, during the closure of the
first 8-membered ring there takes place a partial transforma-
tion into a 4-membered ring, which change is completed
when the final product is prepd. Olefin formation occurs to
a lesser degree. The cleavage of Br in the final step in the
presence of Na_2CO_3 and NaI yields a hydrocarbon mixt.
contg. about 10% spirocyclic hydrocarbon. The 1,1-dimethylcyclo-
propane (prepd. from the diacetate contains a mixt.
of products with 3- and 4-membered rings. Oxidation of
this with $\text{K}_2\text{Cr}_2\text{O}_7$ in aq. H_2SO_4 gave cyclopropanedicarbox-
ylic acid and $(\text{CH}_3\text{CO})_2\text{O}$. Methylcyclobutane yielded 65 g.
in Et_2O treated with 65 g. of Na with ice cooling yielded 65 g.
1-bromomethyl-1-bromocyclobutane, bp. 78-80°, d_4^{20} 1.7944,
 n_D^{20} 1.53531, Raman spectrum (cm.⁻¹) 186(2), 203(8), 432-
(3), 611(3), 652(2), 658(10), 665(2), 678(2), 908(6), 923(4),
937(1), 1012(2), 1227(2), 1325(4), 1346(1), 1423(4), and
1462(1). This with Zn dust yielded 80% pure methylene-
cyclobutane, bp. 41.6°, d_4^{20} 1.4186, Raman spectrum
452(5), 474(1), 658(5), 777(1), 874(1), 906(3), 952(10),
1101(2), 1398(3), 1427(2), 1670(8), 2367(1), 2908(8), 2940-
(8), and 3068(2). Reducing the dibromide with AgOAc
and AcOH 6 hrs. gave pure 1-(hydroxymethyl)cyclobutanol

Assimilation of margarine and its comparative evaluation. E. S. London, N. I. Shokhov and I. V. Popel. *Schriften zentral. biochem. Forschungsinst. Nahr. Genussmittel.* (Moscow) 2, 201-82(1932).—Feeding tests with dogs showed 95-97% assimilation of butter, 94-95% assimilation of margarine. Margarine feeding gave no perceptible symptoms of toxicity, and the test animals gained about the same amt. in wt. in the same time as animals fed with butter. Hence margarine of the kind tested (a Russian product) is fully equiv. to butter with respect to assimilation. Julian P. Smith

Metallurgy in the light of the electrochemical series
 I. I. Iskol'dskii and T. G. Shokhor. *J. Applied Chem.* (U.S.S.R.) 19, 603-704 (1946) (in Russian). -- (1) Reactions were investigated between powd. (70 mesh) metals and oxides, in batches of 25 g. oxide, 3 g. NaF as flux, 19 g. BaO₂ + 1 g. metal powder as initiator, kindled by a Mg ribbon. In *tinothermy*, $3\text{Si} + 2\text{Fe}_2\text{O}_3 = 3\text{SiO}_2 + 4\text{Fe}$, with the stoichiometric amt. of Si, only 12.8% of the Fe was reduced; the alloy obtained was Fe 78.68, Si 21.32; with double the amt. of Si (12 g.), the yield was 67.0%; the alloy Fe 79.77, Si 20.23; using Fe₂O₃ prepd. from Fe oxalate, instead of from pptd. Fe(OH)₃, the Si content is higher; without flux, less oxide undergoes reduction. *Ferrothermy* (new reaction) $2\text{Fe} + 3\text{CuO} = \text{Fe}_2\text{O}_3 + 3\text{Cu}$ (initiator BaO₂ + Si), 2.25 g. Cu (with 1% Fe) were obtained with 12 g. Fe. *Berylliothermy* (new reaction) $3\text{Be} + \text{Fe}_2\text{O}_3 = 3\text{BeO} + 2\text{Fe}$, a stoichiometric amt. of Be (4.3 g.), gave 3.24 g. Fe (with < 0.1% Be); with 0.3 g. Be, 3.13 g. Fe; reduction of 25 g. CuO with 2.0 g. Be gave 3.70 g. Cu with 0.1-1.0% Be. *Calciothermy* with Ta₂O₅ 60, Nb₂O₅ 40, stoichiometric amt. of Ca, gave no metal but Ca metatantalate and metacolumbate with small amts. of Ta₂O₅ and Nb₂O₅. Likewise, *Magnesiothermy* with Ta₂O₅ gave only MgTaO₄; with SiO₂ 25 g., Mg 20 g., a mixt. of MgSi and MgO was obtained. (2)

Tabulation of the heats of reduction of 25 oxides (Na₂O, MgO, Al₂O₃, PbO, V₂O₅, WO₃, Re₂O₇, OsO₄, CO₂, SiO₂, ZnO, HfO₂, CeO₂, Ta₂O₅, Nb₂O₅, BeO, CaO, Fe₂O₃, NiO, CrO, ZnO, SnO, PbO, BaO, CdO) by 14 elements (Li, Ca, Mg, Th, Be, Al, Si, Zn, Fe, Co, Pb, C, Cu, Au), compared with the normal electromotive potentials of the latter, elicits a parallelism between the heats and the potentials. A few but not all discrepancies are cor. by considering the heats of reduction of NaCl and of Al₂Si₂ by the elements.

Determination of rare earth in marine deposits. E. A.

Qutunbayev, A. A. Eslanova, and T. G. Shokhor. Trudy

Geol. Inst. Akad. Nauk SSSR 19: 222-223, 1976

The method of indium-magnesium (cf. G. A. 88, 80160) is adopted for detn. of small amts. of rare earth in the presence of large quantities of interfering Fe and Al. The method is used to separate with nitric acid. The gravimetric method is found satisfactory for total quantities of rare earth of the order of 0.0005 g. Smaller quantities are detd. by x-ray spectroscopy. The method is checked on artificial bauxite samples with known amts. of added rare earth and on samples from the bottom of the Black Sea.

Scientific Ed.: Ye.A. Pankina; Ed.: A.L. Bashkovich; Tech. Ed.: A.M. Toker.

PURPOSE: This booklet is intended for foremen, teachers in engineering trade schools, and it also may be useful to workers in the machine-building industry.

COVERAGE: The booklet presents data on the surface-hardening of the working surfaces of cutting, stamping, and measuring tools by chromium plating and by thermochemical treatment in the solid, liquid and gaseous media. The author provides examples of the chromium plating of some tools done in accordance with the new group-processing method developed by S.P. Mitrofanov, Lenin Prize winner. No personalities are mentioned. There are 20 references, all Soviet.

AUTHOR: Shokin, A., First Deputy of the Minister of the Radio-Engineering Industry, USSR
TITLE: Scientists and Radio Specialists Answer Questions of Editors (Na voprosy redaktsii
otvetchayut uchenyye i radiospetsialisty)
PERIODICAL: Radio, 1957, Nr 1, pp 6-7 (USSR)

ABSTRACT: The questions of the "Radio" journal were: (1) On what problems should radio amateurs work at the present time in adopting radio and electronics in the national economy? (2) In what field of radio engineering is their experimentation particularly desirable?

Mass radio amateurism in the Soviet Union has a great importance for radio industry. Radio-amateur work is a source of skilled radio men, who are always sought by Soviet radio plants, design bureaus, and research organizations. Developmental work and mass experimentation by radio amateurs can help in solving many problems of improving radio circuits and radio-equipment parameters. To facilitate this work, better relations are necessary between DOSAAF radio clubs and radio-industry enterprises. At present, manufacture of radio receivers and TV sets has reached 1 million pieces a year, and saving in material is of great importance. A few rubles saved on one receiver or TV set can result in an overall saving of millions of rubles per year. Amateur designers can help greatly in this matter; they should improve radio circuits, transistorize them, and try to cut power consumption as far as possible. Amateurs should help in developing an inexpensive 3-band radio broadcast receiver with a VHF band. Amateurs

TITLE: The Ways of Growth (Puti rosta)

PERIODICAL: Radio, 1957, Nr 5, pp 3-6 (USSR)

ABSTRACT: May 7th has been the "Radio Day" in the USSR. It has a special significance in 1957, the 40th anniversary of Soviet regime in Russia. A review of development of radio engineering and electronics in the Soviet Russia from November 7, 1917, up to 1957 is presented. All main events are noted and connected with policies of Soviet regime. Of later events the following specific points are worth noting:

First Soviet radars "Reven" and "Radut" were designed and manufactured at the Radiotelegrafnyy zavod Morskogo vedomstva (Radio Telegraph Factory of the Navy Office) before WW2. In 1955 the radio-engineering industry (MRTP factories only) produced 20 times as much as in 1940. In 1956 the production was by 29% higher than in 1955. In 1957 a further growth by 23% is expected. Over the Fifth Five-Year Plan period the radio-engineering industry has started production of 750 new items. Over 6,500 items are being manufactured now. The number of research institutes and detached design bureaus has increased sixfold, and the number of specialists employed there tenfold over the period from 1946 to 1956; new are coming in 1957. At the present time the following items are being manufactured: 73 types of electron-beam devices, 225 types of shf devices, 229 types of receiving and amplifying tubes (some of them of a rice-grain size),

Card 1/2

The Ways of Growth

107-57-5-3/63

31 type of x-ray devices, 99 types of gas-discharge devices, 44 types of phototubes and counters, 287 types of special and conventional lighting lamps. Over 100 million electrovacuum devices, and over 20 million semiconductor devices are being turned out per year. Among many other things, various types of magnetrons, superpower klystrons, carcinotrons, TW tubes, etc. are being manufactured. Nearly one million capacitors and as much resistors are manufactured per day. A new material, "segnetoceramic", permitted creation of a new type of nonlinear capacitors. Extensive work is being done on modernization of processing and on organization of mass line production. The Sixth Five-Year Plan envisages introduction of 300 new mechanized, semi-automatic, and full-automatic production lines, of 700 new special machines. It is expected that these machines will be equivalent to 40 to 50 thousand workers. Despite a very steep rise curve the radio-engineering industry is still considered as lagging in its technical level and its economic conditions.

TITLE: [Transactions of the] Conference on the Occasion of the 40th Anniversary of the Nizhniy-Novgorod Radio Laboratory imeni V.I. Lenin (Konferentsiya, posvyashchennaya srokaletiyu Nizhegorodskoy radiolaboratorii imeni V.I. Lenina)

PERIODICAL: Radiotekhnika, 1958, Vol. 13, Nr 8, pp. 71-79 (USSR)

ABSTRACT: From May 22-24, a conference took place at Gorkiy which had been organized by the Gor'kiy Branch of the Scientific and Technical Society for Radio Engineering and Electric Telecommunication Service imeni A. S. Popov. The conference was attended by: B. A. Ostroumov, A. M. Kugushev, A. A. Pistol'kors, N. A. Nikitin, G. A. Ostroumov, V. P. Yakovlev, V. K. Ge, N. N. Pal'mov, F. A. Lbov, A. S. Nikolayenko, I. P. Koterov, S. I. Morugina, Ye. S. Sorokin et al. as well as by a group of former collaborators of the Tver' radiostation. A. M. Kugushev spoke about "The Nizhniy-Novgorod Radio Laboratory imeni V. I. Lenin, L. A. Kopytin on the development of the technique in radio engineering, the establishment of radio communication facilities and television apparatus. A. I. Shokin spoke about the development of the Soviet radio-engineering industry during the past 40 years.

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Radiotekhnika, 1958, Nr 4, pp 521-524 (USSR)

ABSTRACT: On May 22, 1958, a conference began in Gor'kiy to mark the 40 years anniversary of the founding of the V.I. Lenin Laboratory in Nizhriy Novgorod. Participants, who numbered over 400, included V.A.Volkova, Secretary of the Party Gorkom in Kalinin, and V.Ye.Skvortsov, Area Chairman for Communications in Kalinin. Speakers such as V.M.Leshchinskiy spoke on developments in Soviet radio engineering, and particularly on the radio laboratory in Nizhriy Novgorod. L.A.Kopytin spoke on "The development of radio-engineering, radio and television"; Professors B.A.Ostroumov and A.A.

Laboratory in Nizhny Novgorod

Pistol'kors, N.N. Izotov, and N.N. Palmov spoke on their work with the radio laboratory; Ye.A. Popova-Kyandskaya (daughter of A.S. Popov) discussed the work of her father. Ya.M. Sorin examined "From the Crystal to the Transistor"; the Conference looked at current transistor production in the USSR.

Ya.N. Nikolayev assessed the work of the Gor'kiy School regarding the oscillation theory, with special mention of Academician A.A. Andronov. Later, D.V. Ageyev spoke on the work of the Radio Department, Polytechnical Institute, Gor'kiy, and B.L. Lebedev discussed research on radio measuring. Professor L.L. Myasnikov evaluated the work of the Research Institute for Radio physics in Gor'kiy. O.N. Malakhov looked at the observations of radio-physicists during a recent expedition in China, April, 1958, the time of the solar eclipse. Finally, A.I. Shokin, Deputy Chairman, State Committee, Council of Ministers of the USSR on radio-electronics, gave a survey report "The Radio-Engineering Industry on the

ABSTRACT: The crystallization of the salts from solutions can only begin and take place in the case of supersaturation of the latter with respect to the respective salt. The extent of initial supersaturation does not only cause the beginning of the crystallization-process, but it also determines its further course. With high values of supersaturation, but low degrees of agitation of the solution, the born crystal begins to grow so rapidly that a zone of concentration which

is lower than in the main mass of the liquid, is formed almost instantly around it. Under these conditions, the further growth of each crystal is determined by the diffusion-ratio of the dissolved substance toward the crystalline surface. It is assumed (references 1,2) that the process of crystallization is in this case within the range of diffusion and that its velocity is proportional to the 1st degree of saturation. With intense agitating of the solution the diffusion-ratio becomes so high that actually no weakening of the solution on the crystalline surface takes place. The velocity of crystallization is determined in this case by the slowest process taking place on the crystalline surface and depends on the degree of supersaturation which exceeds 1. This range is called the kinetic one (ref. 2). A survey on the works of the kinetics of crystallization is given (references 2 to 5,7). Works of this kind on the velocity of crystallization of sodium-bicarbonate from soda solutions are lacking, however, 2 processes take place simultaneously in the crystallizing

column with the industrial production of purified bicarbonate:
a) Absorption of CO_2 and b) Crystallization of sodium
bicarbonate. The process b) must obviously influence the
kinetics of carbonization in a certain way and viceversa.
In the first communication the influence of supersaturation,
of the temperature and of the agitation on the velocity
of crystallization of sodium bicarbonate from the soda
solution in the process of carbonization is investigated.
A device developed for this purpose is given in figure 1.
The test-method is described. Figure 2 shows the dependence
of the precipitated quantity of bicarbonate on the period
of carbonization of the solution and that for 2 numbers of
revolutions of the stirrer (340 and 2000 revolutions per
minute) at 20° . It was proved that the velocity of
crystallization of sodium bicarbonate in the range of
diffusion depends on the supersaturation of 1st degree,
whereas it is proportional to the 2nd degree of super-
saturation within the kinetic range. A different dependence

of the velocity of crystallization on the temperature within the range of diffusion and kinetics was proved. Within the first range, this velocity decreases according to the increase in temperature with a given supersaturation, whereas it increases in the latter range. A method of calculation of the velocity of crystallization for the two ranges of the process of crystallization was proposed. There are 10 figures and 7 references, 7 of which are Soviet.

TITLE: On the Non-Equilibrated State of the System in the
Carbonization-Process of the Ammoniacal Brine
(O neravnovesnom sostoyanii sistemy v protsesse
karbonizatsii ammiachnogo rassola)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy.
Khimiya i khimicheskaya tekhnologiya, 1958, Nr 1,
pp. 108-118 (USSR)

ABSTRACT: In this process sodiumbicarbonate begins to precipitate
from the solutions highly supersaturated with it (references
1,2). The supersaturation decreasing after the beginning of
crystallization is preserved until to the end of the process
of carbonization. The permanence of the non-equilibrated
state in the system to be carbonized, as a whole, is caused
by this. Approximating the equilibrium, not only the con-
centration of HCO_3^- and Na^+ ions is changed in such a solution,
the surplus of which is converted into the deposit, but
also the concentration of other components of the solution
(CO_3^{2-} , NH_2COO^- - and OH^- -ions) since the conditions of

Card 1/4

On the Non-Equilibrated State of the System in the
Carbonization-Process of the Ammoniacal Brine (Rassol)

153 -58-1-17/29

equilibrium of the reactions in the solution change. Taking furthermore into consideration that the crystallization of NaHCO_3 involves a certain change of volume of the liquid phase, it becomes apparent that the composition of the non-equilibrated solution must differ from the equilibrated solution with respect to all components. The composition of the former can be determined rather accurately by means of analysis. The same is to a large extent also the case with ammonia-carbonate(e'). The non-equilibrated concentrations of other components ($\text{HCO}_3^- = g'$ non-bound ammonia = m' and the carbonic acid bound as $\text{CO}_3^{2-} = f'$) can only be determined by means of calculation. For this purpose, strictly speaking, only the equations (1) and (2) can be indicated which do not connect the non-equilibrated concentrations of individual components: $d' = e' + f' + 2g'$ (1); $m' = a' - b' - d' + g'$ (2), in which case a' is the total quantity of NH_3 , d' = the total CO_2 and b' the bound NH_3 . From this, further equations for the constant (K_2) of the reaction $\text{HCO}_3^- + \text{OH}^- \rightleftharpoons \text{CO}_3^{2-} + \text{H}_2\text{O}$ (3) are derived for the connection between the non-equilibrated solution and

Card 2/4

On the Non-Equilibrated State of the System in the 153-58-1-17/29
Carbonization-Process of the Ammoniacal Brine (Rassol)

the equilibrated solution (4), (5), (6) corresponding to it. A complete composition of the equilibrated solution can be calculated from its 3 known components for the given temperature (ref. 6). When the non-equilibrated concentrations of the 5 components: a' , b' , c' , d' and e' are determined by analysis, complete compositions both for the non-equilibrated and the equilibrated liquid phase can be calculated at a given temperature. Results of the former for the process referred to in the title at 20, 40 and 60° are given in table 1 to 3. They are substantially different from those of the corresponding equilibrated solutions. The degree of the distance of composition of a solution from that of an equilibrated one depends on the temperature. During the whole course of the process referred to in the title, a carbamate supersaturation exists which is crystallizing in the final stage. The total vapor pressures of CO_2 , NH_3 and H_2O at 20, 40, 50 and 60° above the non-equilibrated ammonia-salt solutions during their carbonization-process were determined here for the first time. An equation was deduced which allows the calculation of the

Card 3/4

On the Non-Equilibrated State of the System in the Carbonization-Process of the Ammoniacal Brine (Rassol) 153-58-1-17/29

"metastable" CO_2 partial pressures above the solutions in the aforesaid carbonization according to a known, non-equilibrated composition of the liquid phase. The authors finally proposed a method of determination of the vapor tension above the solutions by means of a static method. There are 6 figures, 3 tables, and 9 references, 6 of which are Soviet.

Absorption Kinetics of the Carbonic Acid by Soda Solutions (Sobshcheniye II. Kinetika absorptsii uglekisloty sodovymi rastvorami)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1958, Nr 2, pp 90-95 (USSR)

ABSTRACT: Although the problem mentioned in the subtitle has already been treated in numerous papers (Refs 1-6), the results of these investigations are so contradictory that no uniform conception can be achieved regarding these kinetics. In the present paper, the action of the concentration of the sodium bicarbonate solution and its degree of carbonation on the absorption rate of carbonic acid under various hydrodynamical conditions were studied. An absorption-equipment of the film-type was used for this purpose, the construction and mode of function of which are described. First of all, it was to be in-

tion rate on the concentration of the solution. It can be seen from this that the velocity mentioned exceeds a maximum at a change of concentration of the solution. The authors explain this by an increase of the degree of hydrolysis of the sodium carbonate with the dilution of the solution. If, however, the soda concentration becomes insignificant because of further dilution, the rate of absorption drops and comes close to that of water. In order to investigate this, the pH was measured (Fig 4). According to the results the pH-curve during the dilution is a reproduction of the course of the curves of the absorption rate. Thus, this rate depends on the OH^- ion concentration. This was expressed by equation (2). The influence exercised by the carbonation degree of the solution upon the absorption rate was studied by means of an installation previously described (Ref 9). Furthermore the authors apply the term "Degree of transition" instead of "Degree of carbonation" of the solution. Figures 5 and 6 show the dependence of the CO_2 -absorption rate on the degree of transition for different
